

project requirements

Prompt

I've created a new Next.js polling app project. I want to prepare it for upcoming features like user authentication, viewing polls, and creating a new poll. Help me scaffold an initial folder structure and placeholder files for those areas. Use Shadcn components.

Response

Prompt

Can you help me brainstorm and design the architecture for this app? Specifically:

- How would you structure the Next.js project (App Router, route handlers, server components, etc.)?
- How should the overall system be architected across frontend, backend, Supabase, and Vercel?
- Any recommendations for modeling poll data and securing voting logic with Supabase?
- How would you handle QR code generation and scanning?

- What tools or libraries would you suggest to accelerate development and ensure scalability?
and but docs in the docs folder.
